

Sprint 1 — Project setup

BEFORE CRUD

GOAL

A GitHub repository that runs FastAPI, connects to MySQL, and has a React app folder. Another trainee can follow the README. No trainee or batch APIs yet.

DO THIS

1. Create or clone the assigned GitHub repo (SSH). Branch: `tms/sprint-1-setup`.
2. Create the folders below.
3. Create MySQL database `dttp_tms` and user `tms_dev` (local password, not in chat).
4. FastAPI GET `/api/health` returns `{ "status": "ok" }`.
5. React (Vite + TypeScript) `npm run dev` loads in Chrome.
6. README: Python version, database, install, run backend, run frontend.
7. Commit, push, open a pull request.

```
tms/
├── backend/
│   ├── app/main.py
│   ├── requirements.txt
│   └── .env.example
├── frontend/      ← Vite React + TypeScript
├── README.md
└── .gitignore
```

.ENV.EXAMPLE

```
MYSQL_HOST=localhost
MYSQL_PORT=3306
MYSQL_USER=tms_dev
MYSQL_PASSWORD=use-a-local-password
MYSQL_DATABASE=dttp_tms
```

Never commit `.env`.

DONE WHEN

- | | |
|---|--|
| ☐ Repo is on GitHub | ☐ React opens in Chrome |
| ☐ GET <code>/api/health</code> works | ☐ README another trainee can follow |
| ☐ MySQL <code>dttp_tms</code> exists | ☐ Mentor reviewed the pull request |

Then start Sprint 2 (trainee and batch CRUD). Not before.
